PCR primer; ss

Human chromosome 1p36-35 PCR primer SEQ ID NO:344.

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimmlating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, grotein coupled receptors and thioseterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by the may be used in the prevention, diagnosis and treatment of diseases complicated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include consistencial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Garve's disease), inflammation, cancer colour and kidney, cancers of the bladder, brain, breast, colon and kidney, conversions. cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytochrome; kinesin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection; Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections. 918 ATCATCACCACCACCTCCAGAGATTTTACGCAAGAGAGCCAAATTGA 967 17.2%; Score 50; DB 1; Length 50; 0; Indels Sequence 50 BP; 9 A; 7 C; 15 G; 19 T; 0 U; 0 Other; 0.00037; 100.0%; Pred. ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                 The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; co a signal corresponding to the marker is detected from the resultant corresponding to the marker is detected from the resultant corresponding to the marker is detected from the resultant corresponding to the marker sequence; (d) the order plates containing the clones having said marker sequence; (d) the order cof the maximum in the specified discrimination Nos. to array the multiwell cof the maximum in the specified discrimination Nos. are mixed respectively in each wells of longitudinal collutures are maplified by using the above primer; (g) signals and lateral directions; (f) the mixed clones are cultured and the constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The chromosome for human chromosome and arrayed, and PRE4532 represent correspondent por purpose to the present invention correspondent invention.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates (b) a primer designed based on the chromosome marker completed; (b) a primer designed based on the chromosome marker is equence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant corpuses containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell corpuses; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the corpus in the multiwell plates of the specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABLA3522 represent corpus are for human chromosome lab3-35 bNA, and ABL45321 capresent corpus corpus for human chromosome 21q221, which are represent corpus in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA265, hVPLA2 and HPLA2-10. The antisense oligomucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; phospholipase A2; PLA2; calcium dependent phospholipase A2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calculum dependent phospholipase A2, PLAGS, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoinmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The artisense compounds are also useful for modulating PLA2 group V. The artisense compounds are also useful for faignostics, therapeutics, prophlaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ·;
                                                                                                                                                                                                                                                             New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Phosphorothioate backbone; All cytidines are 5-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                       The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2. PLA2GS, hVPLA2GS, hVPLA2GS, hVPLA2L3 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             / not\bar{e} = "Phosphorothioate backbone; All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; phospholipase A2; PLA2; calcium dependent phospholipase A2; PLA2G5; hVPLA2; HPLA2-10; therapy; autoimmune disorder; prophylaxis; inflammatory disorder; antisense; phosphorothioate backbone; ss.

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2. PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ņ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Phosphorothioate backbone; All cytidines are 5-
methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, phospholipase A2; PLA2; calcium dependent phospholipase A2;

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an mutoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oilgonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonuclectides for modulating phospholipase A2 group V gene expression, particulatly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Phosphorothioate backbone; All cytidines are methylcytidines"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA265, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ភ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= a

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HFLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for modulating PLA2 group V. The antisense compounds are also useful for finighnostics, therapeutics, prophlaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targeted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Phosphorothioate backbone; All cytidines are 5-

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for modulating pLA2 group V. The antisense compounds are also useful for finagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                               ... autisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA265, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence is an antisense oligonucleotide tragetted to human the present sequence of the present seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA3CS, NVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophlass, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; phospholipase A2; PLA2; calcium dependent phospholipase A2; PLA2G5; hVPLA2; HPLA2-10; therapy; autoimmune disorder; prophylaxis; inflammatory disorder; antisense; phosphorothicate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calciuw dependent phospholipase A2, PLA2G5, hVPLA2 and HFLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for diadnostics, therapeutics, prophlaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targeted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2. PLA2GS, NPDLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides for modulating phospholipase A2 group {\rm V} gene expression, particularly useful for treating an autoimmune disorder
                                                               //note= "Phosphorothioate backbone; All cytidines are 5-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2GS, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.

Human PLA2 antisense oligonucleotide, ISIS 128036. ACC82864/c ID ACC82864 standard; DNA; 20 27-AUG-2003 (first entry) ACC82864; RESULT 21 

Human, phospholipase A2, PLA2, calcium dependent phospholipase A2, PLA2G5; hVPLA2, HPLA2-10, therapy, autoimmune disorder, prophylaxis, inflammatory disorder, antisense; phosphorothioate backbone; ss.

Homo sapiens

ö The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPHA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V, the antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder

PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder
                                                                                                                                                 5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA265, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                           5

Claim 1; SEQ ID NO 83917; 9pp; English.

.; 0 The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder. The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dother hybridisation to identify or detect the sequence or specific mittations of any gene, in mapping the 5' termin of mittations of any gene, in mapping the 5' termin of mittations of any gene, in mapping the 5' termin of mittations of any gene, in mapping the 5' termin of mittations of any gene, in mapping the 5' termin of mittations of any gene, in mapping the 5' termin of propers and propers and

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismacch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, or analysis of genetic variation or in hybridisation to a DNA library, or at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific comparison. Both by thy distance or in servening cDNA or genomic libraries or subclones contact the sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence or general patent can also be obtained in electronic format directly format directly and a patent can also be obtained in a lectronic format directly and a patent can also be obtained in an electronic format directly and an analysis of the sequence.
                                                                                                                    New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 24812; 9pp; English.

New Dirofilaria and Brugia ankyrin proteins and nucleic acid encoding them, useful for treating and protecting animals from diseases caused by parasitic helminths, e.g. heartworm disease, elephantiasis or hydrocele.

Example 10; Col 46; 120pp; English.

The invention relates to ankyrin proteins and nucleac actus from the parasitic helminths Dirofilaria immitis and Brugia malayi. It also relates to antibodies raised against such ankyrin proteins and to relates to antibodies raised against such ankyrin proteins and to compounds that inhibit Dirofilaria or Brugia ankyrin function.

CC Dirofilaria ankyrin cDNAs were isolated from a D. immitis 48 hour L3 CDNA library using PCR primers based on the sequence of the E1 ankyrin from Onchocerca volvulus and the Caenorhabditis elegans ankyrin UNC-44 genes.

CC Interpretation of Brugia ankyrin proteins and nucleic acids represent novel interpretation or Brugia ankyrin proteins and drugs. Ankyrin nucleic acid molecules, proteins, vaccines and drugs. Ankyrin nucleic acid molecules, proteins, vaccines and drugs ankyrin nucleic acid molecules, proteins, vaccines and compositions are useful for protecting animals, particularly dogs, from diseases caused by parasitic helminths (e.g., heartworm diseases, elephantiasis or hydrocele, as well as for treating the infection. The ankyrin nucleic acid molecules, proteins, vaccines and compositions of the invention are especially useful in treating and preventing infections caused filarid mematodes (e.g., D. immitis and B. malayi), and ascarid, capillarid, strongyloides, trichostrongyle, or trichurid nematodes and are also useful against cestodes and trematodes. The therapeutic compositions may borses, cattle, sheep, and other pets, economic food animals; or zoo animals. The ankyrin nucleic acid molecules, proteins and composition of enimals. The ankyrin nucleic acid molecules, proteins and compounds may also be used as diagnostic reagents to detect infection by parasitic compounds cause harmful side effects in the individual being treated, and a number combanist and the parameter of these drugs can only treat the symptoms of a parasitic disease, being end in any ankyrin profein and an animities and B. malayi ankyrin profein and bear and an animities and an animities and an animities an of the The invention relates to ankyrin proteins and nucleic acids from the

immitis and B. malayi ankyrin protein and DNA sequences facilitates the development of agents which inhibit ankyrin-mediated parasite developmental and migratory pathways. Sequences AAAS8201-A58219 and AAAS8278-A58291 represent PCK primers used in the exemplifications of thinvention to isolate D. immitis and B. malaya ankyrin cDNAs

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its conformatch, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises the nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, comparisons lead to a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid containing the 5' termini of mRNA molecules by primer extensions of any gene, in mapping the 5' termini of mRNA molecules by containing segments of but hybridisation, in sequence presented is one of the isolated and previously sequenced. The sequence presented is one of the contained and previously sequenced. The sequence presented is one of the contained and previously sequenced. The sequence presented is one of the contained and previously sequenced. The sequence presented is one of the contained and previously sequenced in the microarray. Note: The sequence of the form uspro at sequence of the contained in electronic format directly format directly then the contained in the microarray.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotides AAAS8825-58 were used in the analysis and study of the 2q breakpoint region, in the course of the invention to identify the gene encoding a tissue repair protein. Tissue repair gene polynucleotides are useful for determining expression of mRNA in selected target tissue, e.g. for diagnosing and treating orofacial clefting. They are also useful for determining the presence of DNA mutations in patients suffering from, or suspected to be suffering from orofacial clefting. The antibodies are also useful in the diagnosis of orofacial clefting. The polynucleotide is also useful for promoting wound healing and tissue repair
                                                                                                                                                                                                                                           New human and mouse nucleic acids encoding a tissue repair protein, useful for diagnosing and treating orofacial clefting, and for promoting wound healing and/or tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

The invention discloses a microarray comprising a plurality of mucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by Mybridisation to a DNA library, in analysis of genetic variation or in hybridisation of taq-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises bybridising at least one or more nucleic acids to at least two or more uncleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or dottor hybridisation to identify or detect the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by comparisons of any gene, in mapping the 5' termini of mRNA molecules by comparisons of any gene, in mapping the 5' termini of mRNA molecules by committed and previously sequenced. The sequence or specific or uncleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly to the manaly sequence or the contract of the sequence or specific or the manaly sequence or the contract of the sequence or specific or sold probes incorporated in the microarray. Note: The sequence or specific or sold probes incorporated in the microarray. Note: The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The present invention describes a chimeric bifunctional molecule (I)

comprising at least a first functional molecule covalently linked to a

second functional molecule, which is able to modulate the activity of the

permeability transition pore complex (PTPC) of the mitochondria. (I) has

the function of specifically targeting and entering a tissue cell

specifically targeting, and inducional molecule has the function of

specifically targeting, and inducion or tree chosing of the PTPC of the

mitochondria or its fragment. (I) has virucide, neuroprotective,

vasotropic and cytostatic activities, and can be used as a mitochondrial

permeability transition pore complex (PTPC) modulator. (I) is useful for

treating or preventing a pathological infection or disease. (I) is also

cuseful for regulating cell death regulatory molecules, specifically the

apoptogenic function of the PTPC, for treating e.g. cancer, ischaemia,

consorted the consorted and pathological infections or viral infections. The

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 71746; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used

in monitoring gene expression levels by hybridisation to a DNA library, an analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises worked probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotuce or probes is useful in in situ hybridisation, in Southern, Northern or dotuce of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening Segments of DNA that have been candational subclones containing segments of DNA that have been call solutions between the microarray. Note: The sequence of the from HOPPIN at an also be obtained in electronic format directly from USPTO at segdata.uspto.goc/sequence.html

(intramuscular fat content). Human DGAT is located to chromosome 8, and bounce DGAT is located to chromosome 14. (I) is useful for testing a mammal for its predisposition for fat content of milk and/or its predisposition for meat marbling. The method comprises analysing the gene encoding DGAT for nucleotide polymorphisms (e.g. single nucleotide polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polymeptide which is encoded by the gene. The mucleic acid molecule has at the position 1043 and 10434 of the DGAT gene a quanine and a cytosine residue, at position 3343 as cytosine or quanine, and low act a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT cresidues which correlate with a predisposition for high content of milk and high meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine residues which is responsible for the regulation of the expression of the present sequences used in the exemplification of the present

Winter A; Fries H,

WPI; 2003-239205/23.

New nucleic acid molecule comprising a sequence of an allele of a polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for testing a mammal for its predisposition for fat content of milk and for testing a mamm meat marbling.

Example 1; Page 35; 91pp; English.

The present invention describes a nucleic acid molecule (NA) (I) encoding

cc a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or indicative for low fat content of milk and to low meat marbling (intramuscular fat content). Human DGAT is located to chromosome 8, and bovine DGAT is located to chromosome 8, and commiscular fat content). Human DGAT is useful for testing a mammal for its predisposition for fat content of milk and/or its predisposition for fat content of milk and/or its predisposition for meat marbling. The method comprises analysing the gene cocoding DGAT for nucleotide polymorphisms are located in the roding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polypeptide which is encoded by the gene. The nucleic acid molecule has at the position 10433 and 10434 of the DGAT conceince of the polypeptide which is encoded by the gene. The nucleic acid molecule has at the position 10433 and 1033 a cytosine or cytosine and a cytosine or thymine and allogs a cytosine or thymine and allogs a cytosine or thymine and indo a quantine, 11048 a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position of corresponding to position 10433 and 10434 of the DGAT gene two adenine cresidues which correlate with a predisposition for high content of milk and how meat marbling. The nucleic acid molecule has at the position of the gene encoding DGAT. New composition containing an aerosolized antisense ET-1 molecule useful for treating pulmonary hypertension.

Claim 13; Page 22; 37pp; English.

The invention relates to a method for treating pulmonary hypertension by delivering a therapeutic composition, comprising an aerosolised antisense endothelin-1 (ET-1) molecule, to the lungs of a patient. The composition

..

Gaps

```
e.g. when studying molecules and observing the effects of the composition on an animal model system hypersensitive to antisense ET-1. The method is useful for treating pulmonary hypertension. The aerosolised antisense ET-1 molecule permits inhibition of the ET-1 transcription, which relieves pulmonary hypertension. Its use avoids side effects caused by alternative therapies. Sequences AAX32375-386 represent specifically claimed antisense ET-1 sequences of rat origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   methylation in a target nucleic acid sequence using probe sets complementary to first and second binding domains located upstream and domstream of one or more methylation sites of interest in a nucleic acid sequence. Methylation determination can be combined with the detection of polymorphisms, including single nucleotide polymorphisms and/or gene dosage determinations, to provide a more complete genetic profile at a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the methylation status of a target nucleic acid sequence, for identifying candidate disease genes, comprises utilizing probe sets complementary to first and second binding domains of the methylation site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to methods for detecting the presence or absence of

         candidate disease genes. The present polyfluorescenated reporter probe, denoted REP1, was used in a methylation assay of the tumour suppressor p53 gene for use in lung cancer screening. The probe corresponds to nuclectides 1796-1774 of the gene. A 1080 bp sequence from exon 5 throug intron 7 of the p53 gene was used as target. This contains 4 HpaII sensitive CpG methylation sites known to be associated with malignant

oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where oligonuclectide probes (II) will hybridise with little mismatch, where for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigatus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, buman papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This primer was designed at the start of the mature protein for the opium poppy berberine bridge enzyme (PSBBS) gene. It was used with a primer (see AAV27300) from the stop codon region of the PSBBS gene to isolate the mature portion of the PSBRS gene. A BLAST homology search revealed high homology between PSBBS and the amino acid sequence of MS59 antifungal protein (see AAW5503) of sunflower. Claimed antifungal protein (see AAW5503) of sunflower. Claimed antifungal proteins, including MS59 and its homologues, have a mol.wt. of 55-65 kDa (SDS-PAGE), have carbohydrate oxidase activity, show anti-Phytophthora and/or anti-Pythium activity, can be expressed in transgenic plants to reduce susceptibility to infection by fungi, or expressed in host cells for use in antifungal compositions. Plants engineered to express the longer shelf-life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New plant proteins having anti-fungal activity - useful as, e.g. carbohydrate oxidase(s) for protection against Phytophthora and Pythium

Detecting cancer involving oncomes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancers is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonoleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI87546 represent oligonucleotide sequences used in the exemplification The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonnella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polito virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, furner Syndrome and obesity defects. hydroxylase deficiency; Turner Syndrome; obesity; cancer; Designing capture oligonuclectide probes for use on a support to which complementary oligonuclectides hybridize with little mismatch. oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss. The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are medified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that is sesential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus can for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the cativity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, cativity. The method is useful for identifying a compound having the ativity to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a per primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                Claim 36; SEQ ID NO 4849; 167pp + Sequence Listing; English

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

Claim 1; Page 66; 83pp; English.

primer extension (SNPE) primers, and the sequences of regions flanking sites of single mucleotide polymorphisms SNPs. The present invention sites of single mucleotide polymorphisms SNPs. The present invention coligonucleotides with some states of the invention. The PCR primers are used to amplify a coligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by the oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular costeogenesis imperfecta and caute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial confidence in confidence in or may be genetic such as autoimmune diseases including rhemmand acute intermittent porphyria. Phenotypic colisease of which a component is or may be genetic such as autoimmune diseases. diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide for a human SNP containing DNA sequence

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids. (SL1, ABBA399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Thuman POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of right of the signal transduction pathway. (I) is useful concoding (I) are useful for diagnoshing, monitoring dissease and treating caused by altered expression of human POSHL1 including diagnosing and cuseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the prevent by the European Patent Office
                                                                                                                                                                                                                                     Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1
                                                                                                                                                                                                                                                                                                                                Example 2; SEQ ID NO 1116; 60pp + Sequence Listing; English.

fragments (F) from the target nucleic acid, and (ii) analysing by mass fragments (F) from the target nucleic acid, and (ii) analysing F by mass pectrometry (MS). The sequences in AAV39483 to AAV39592 are specifically claimed primers for use in the mass spectrometric analysis of the above process. The process is used to detect genetic diseases (e.g. haemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's disease, cystic fibrosis and many others) or chromosomal abnormalities (or predisposition); infections and cancers; also for establishing identity and heredity. Particular applications are diagnosis of the compatibility, and in genetic fibrosprinting. Compared with known methods using MS, this process requires fewer specific reagents and is better suited to automation. Extended primers are shorter; primer annealing is more efficient and the process allows detection of many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                         Sequencing nucleic acid by mass spectrometric analysis - for detecting nucleic acids, telomerase activity, oncogene mutations, or cancerspecific sequences, for diagnosis of disease.

ARZESES4 to ARZESES represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. ARZESES9 to ARZT7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the cidentification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the cyfifications responses to and side effects from the sequence sequence in the SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and and in the Sequence Listing from the
                                                                                                                                                 Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5.3%; Score 15.4; DB 1; Length 19; 94.1%; Pred. The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in multiwell plates; (b) a primer designed based on the chromosome marker content of a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell containing the clones having said marker sequence; (d) the order coft the marker is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell classification Nos. are mixed respectively in each wells of longitudinal discrimination Nos. are mixed respectively in each wells of longitudinal confliction and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome; Claim 4; Page 46; 528pp; Japanese. 10-MAR-2000; 2000JP-00066716. 12-MAR-2001; 2001JP-00068285. ```
AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584 - AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                      .

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch. Designing capture oligonucleotide

Example 5; Fig 29; 300pp; English.

oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (I) will hybridise with little mismatch, where oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal hapectious agents e.g. Cryptococcus neoformans, Candida albicans and hapergillus fumigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as I hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 10 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning The present invention describes a method (M1) for designing capture 

0 electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. New inhibitors of DNA methyl transferase isoforms, e.g. anti-DNA methyl transferase oligonucleotides or small molecule inhibitors of DNA methyl transferase, useful for treating cell proliferative and differentiation disorders.

Claim 14; Page 23; 76pp; English.

The invention relates to an agent that inhibits one or more specific DWA methyl transferase isoforms (but not all DWA methyl transferase isoforms), such as an anti-DWA methyl transferase oligonucleotide or a small molecule inhibitor of DWA methyl transferase. The agents, oligonucleotides, inhibitors and methods are useful for identifying specific inhibition of specific DWA methyl transferase isoforms involved in cell proliferation and/or differentiation, and thus providing a treatment for cell proliferative and/or differentiation disorders, e.g. memplasia. This polynucleotide sequence represents a human DWA METASE. DNMT 1 oligo relating to the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; methyl transferase inhibitor; DNA methyl transferase isoform; gene therapy; anti-DNA methyl transferase oligonucleotide; inhibitor; cell proliferation; neoplasia; DNMT 3a; enzyme; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an agent that inhibits one or more specific DNA methyl transferase isoforms (but not all DNA methyl transferase isoforms), such as an anti-DNA methyl transferase oligonuclectide or a small molecule inhibitor of DNA methyl transferase. The agents, oligonuclectides, inhibitors and methods are useful for identifying specific inhibition of specific DNA methyl transferase isoforms involved in cell proliferation and/or differentiation, and thus providing a treatment for cell proliferative and/or differentiation disorders, e.g. neoplasia. This polynucleotide sequence represents a DNMT3a oligo sequence relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New inhibitors of DNA methyl transferase isoforms, e.g. anti-DNA methyl transferase oligonucleotides or small molecule inhibitors of DNA methyl transferase, useful for treating cell proliferative and differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

This primer can be used in the amplification-based detection of a fungal internal Transcribed Spacer (ITS) DNA sequence. This sequence was derived from the ITS sequences, specifically from the regions of the ITS which exhibit the greatest difference among the fungal pathotypes. This allows the identification of specific pathogens and provides a method for
New internal transcribed spacer DNA from fungal pathogens, used as
                            sources of primers and probes for pathogen detection.
                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 5 A; 4 C; 10 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ठ
                                                                                                                                                                                                                                                                                    Sequencing complex genomes, present as fragments in a cosmid library - by sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences were determined from the ends of chromosome 11-specific cosmids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               by automated sequencing without intermediate subcloning. A sample of 371 bNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-Q82706 for STS primers. (Also see AAQ91325-58). (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 5 A; 9 C; 1 G; 6 T; 0 U; 0 Other;

This is a downstream primer for inositol polyphosphate-1 phosphatase (INPP1). Comparative anchored tagged sequences (CATS, see AAX24422-AAX24439), i.e. primer pairs that amplify a sequence tagged site from the orthologous gene in different species, were developed for a series of genes flanking Col3A1 on the human map and for which sequence information was available in more than one mammal, in order to refine the correspondence between HSA2431-33 (human chromosome 2) and BTA2412-22 (bovine chromosome 2). The CATS were used to screen a 6-genome equivalent comparative mapping was performed to define the bovine m(muscular hypertrophy) locus. The invention relates to factors affecting muscle development in mammals, especially to the identification of the bovine myostatin gene (see AAX24415). Cattle homozygous for a mutated myostatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                Increasing muscle mass in mammals - by decreasing myostatin expression.
                                                                                                                                                                                                                                                                                                                                                                                        Ď;

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human c-fos gene by RNA interference. The siNAs may or may not comprise riborncleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                          short interfering RNA; siRNA; double-stranded RNA; mirro-RNA; miRNA; short hairpin RNA; siRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; entraction gene function analysis; gene mapping; parkinson's disease; huntington's disease; palpersy; dementia; parkinson's disease; huntington's disease; proliferative disease; restenosis; polycyptic kidney disease; inflammatory disease; transplant respection; viral infection; HIV infection; autoimmune disease; transplant respection, vasotropic; nootropic; antiparkinsonian; neuroprotective; cytostatic; antiinflammatory; antiallergic; human; c-fos; ss.

(SiRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the c-fos gene in cells, tissue explants or organisms of expression of the c-fos gene in cells, tissue explants or organisms of treatment of a variety of conditions. They may be used for treating central nervous system lesions and injuries (e.g., Alzheimer's disease, Parkinson's disease, Huntington's disease, epilepsy, dementia or amyotrophic lateral sclerosis); various cancers; other proliferative diseases (e.g., restenoists and polycystic kidney diseases); inflammatory and/or allergic diseases; viral infections (including HIV infection); autoimmune diseases; viral infections (including HIV infection); caucoimmune diseases; utransplant rejection. The sinAs are also useful for drug screening, diagnosis, therapeutic target identification and cultivation, and gene mapping (e.g., of single nucleotide polymorphisms).

(SIRN-) SIRNA THERAPEUTICS INC.

Beigelman Mcswiggen J,

WPI; 2003-679877/64.

New short interfering nucleic acid downregulates expression of the cgene useful for treatment and diagnosis of diseases, e.g. cancer and inflammation.

Example 3; SEQ ID NO 89; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human c-fos gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense coligonuclectide. Specifically, the siNAs include short interfering RNA (SiRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a cort the in vitro or in vivo delivery of siNA; conjugates and/or complexes for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate cypression of the c-fos gene in cells, tissue explains or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the creatment of a variety of conditions. They may be used for treating central nervous system lesions and injuries (e.g., Alzheimer's disease, Parkinson's disease, Huntington's disease, epilepsy, dementia or amyotrophic lateral sclerosis); various cancers; other proliferative diseases (e.g., restenosis and injuries (e.g., Alzheimer's disease); inflammatory autoimmune diseases; urial infections (including HV infection); contral und gene mapping (e.g., of single nucleotide polymorphisms).

Coff of and secure apping (e.g., of single nucleotide polymorphisms).

Coff of the present sequence represents the upper strand of a human c-fost target semence.

```
first active agent comprising an oligonucleotide antisense to the intration codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intrance agent comprising an oligonucleotide antisense to the intration codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antishlammatory steroid in a subject, for reducing levels of adenosine ceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung suffactant in a subject, stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel nucleic acid which hybridises with the DNA of dechlorination bacteria preferentially at the chlorinated ethylene decomposing gene or at a position upstream of the DNA. The novel nucleic acid is useful for detecting dechlorination bacteria, by performing a polymersae chain reaction (PCR) using the novel nucleic acid for the primer and the nucleic acid(s) present in the sample bacterium for the comparts of the deriving the synthesized DNA fragments. A labelled probe of the derived from the novel nucleic acid is useful for detecting to achieve the novel nucleic acid is useful for detecting the synthesized DNA fragments. A labelled probe of the derived from the novel nucleic acid is useful for detecting to effect an RNA- or DNA-hybridisation, and detecting the label of the probe. The novel nucleic acid or its probe are useful for detecting high performance dechlorination bacteria, especially those exhibiting high activity of decomposing vinyl chloride. This polynucleotide sequence represents a PCR primer relating to the dechlorination bacteria DNA hybridising nucleic acid of the invention
                                                                                                                                                                                              Novel nucleic acid which hybridizes with DNA of dechlorination bacteria preferentially at chlorinated ethylene-decomposing gene or at position upstream of DNA, useful for detecting dechlorination bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 5 A; 0 C; 7 G; 8 T; 0 U; 0 Other;

rine present invention describes mammatian SNOKF35 teceptors. SNOKF35 antibacterial, antifungal, antibactarial, antifungal, antivarial, antiparthy on antibacterial, antifungal, antivarial, antiparthy on our operation antibacterial, antifungal, antivarial, antiparthy on our operation antibacterial, antifungal, antibactic, antibacterial, antibacterial, antiparthy antiparthy antibactic, antibacterial, antiparthy and anticonvulsant activity. The SNORF36 creeptor nucleotide sequence can be used to produce transgenic non-human amammals, expressing a SNORF36 receptor, to determine inhibitors, activators, agonists and antagonists of SNORF36, to determine the physiological effects of varying levels of SNORF36, to determine the cisanose a predisposition to a disorder. The agonists and antagonists are used to treat abnormalities associated with SNORF36 expression. The receptor is used to design drugs for treating chronic and acute inflammation, arthritis, autoimmune diseases, transplant rejection, baccerial, fungal, protozoan and viral infections, septicemia, acquired immunodeficiency syndrome (AIDS), pain, psychotic and neurological disorders, anorexia, nausea, hyper/hypotension, vascular and cardiovascular conservatia, nausea, hyper/hypotension, vascular and cardiovascular disorders, renal disorders, ottoprosis; disease, acute heart failure, and Huntington's disease. The present
                                                                                                                                                                                                                                                                       New nucleic acid encoding a mammalian SNORF36 receptor for determining the physiological effects of varying levels of SNORF36 activity, and for diagnosing a predisposition to a disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes mammalian SNORF36 receptors. Fused gene with DNA expressing polypeptide capable of capturing metal, for recombinant vectors and transformants applicable in purifying environment and recovering metal efficiently, including waste treatment. metal capture; secretory signal; ds. Metal capturing protein related DNA #5. 26-OCT-2000; 2000WO-JP007518. 99JP-00330226. (first entry) Metal capturing protein; waste treatment; primer; (TOYT ) TOYOTA JIDOSHA WPI; 2001-355927/37. Ueda M; WO200138517-A1 19-NOV-1999; 06-SEP-2001 31-MAY-2001 Synthetic. Tanaka A, 

13 ಡ The present invention relates to a fused gene containing DNAs encoding secretory signal peptide, a protein capable of capturing a metal and a protein localised on the cell surface. The gene can be used to express the metal capturing protein, which can then be used in purifying and recovering metal, for example in waste treatment. The present sequence an oligonucleotide described in the exemplification of the invention Sequence 23 BP; 7 A; 11 C; 1 G; 4 T; 0 U; 0 Other; Example 1; Fig 5; 45pp; Japanese.

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 D DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

This sequence is a primer for the human XLIS gene of the invention. The XLIS fragments may be used to detect abnormalities in the expression of the XLIS fragments may be used to detect abnormalities in the expression of the XLIS gene transcripts or to compare their sequence with that of the CXLIS transcripts from patients for in vitro especially prenatal diagnosis of lissencephaly (LIS) (or agyxia-pachygyria), subcortical laminar continuative diseases such as Alzheimer's disease. These disorders mainly affect females as the XLIS gene is X-linked. The XLIS fragments mainly affect females as the XLIS gene is X-linked. The XLIS fragments of isorders and may be used as a tool in genetic counselling. The above consideration as ample for comparison to normal samples in the invitro diagnosis regime. This may also be performed by amplifying XLIS cDNA from the mRNA in the sample or can be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above neurological disorders. In addition XLIS may be used as a marker of neuronal calls at an early stage of development, its discovery increases understanding of both the neuronal movement which leads to development of the cortical region of the brain and of the cortical region of the brain and of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The sequence represents PCR primer IFN-gamma sense, used to follow the progress and/or treatment of multiple sclerosis (MS). This is done by determining the amount of following cytokines, interleukin (IL)-18, IL-12p40, interferon (IFN)-gamma, IL-4, IL-10, transforming growth factor (TGF)-beta, IL-12Rbetal, IL-12Rbeta2 and/or IL-12p35 of the first bological sample obtained from person suffering from or suspected to suffer from MS, and optionally comparing it with a reference value. This method is useful for determining the success rate of treatment of MS by discriminating between patients with MS (regardless of the clinical subtypes) and healthy controls, on the basis obtained from person suffering from or suspected to suffer from MS. The method enables a clinician to be able to determine or further substantiate the clinical subtype of patient quickly and accurately, and immediately upon the first
                                                                                                                                                                                                                                                                                                                             PCR primer; multiple sclerosis; MS; therapeutic; cytokine; interleukin; (IL)-18; IL-12p40; interferon-gamma; IFN-gamma; IL-4; IL-10; IL-12p35; transforming growth factor beta; TGF-beta; IL-12Rbeta1; IL-12Rbeta2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monitoring progress and/or treatment of multiple sclerosis by comparing levels of interleukin (IL)-18, IL-12p40, interferon-gamma, IL-4, IL-10, transforming growth factor-beta, IL-12Rbetal, 2 and/or IL-12p35.
                                                                                                                                                                                                                                                                   PCR primer IFN-gamma sense used to follow progress/treatment of MS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is a PCR primer for the Streptococcus pneumoniae ratC DNA of the invention. The ratC protein may be used to screen for its agonists and antagonists by contacting it with a candidate compound and detecting any alteration in the activity of ratC. Alternatively, the effect of a candidate compound on the production of mRNA encoding ratC may be detected using an ELISA assay. Agonists of ratC may be administered to patients to treat conditions associated with increased expression or activity of ratC. Agonists of ratC may similarly be used to treat conditions arising from altered expression or activity of ratC. Diseases or conditions arising from altered expression or activity of ratC conditions arising from altered expression or activity of ratC detecting a mutation in the ratC coding sequence in the genome of the content of the ratC coding sequence in the genome of the companient. These diseases or conditions include bacterial infections, especially Streptococcus pneumoniae infections, and Helicobacter pylori infections, office media, conjunctivitis, pneumonia, bacteraemia, meningitis, sinusitis, and gastrointestinal carcinomas. A computer readable medium containing the ratC man account of the containing the ratC man agastrointestinal carcinomas. A computer readable medium containing the ratC man account of the containing the ratC contains account of the containing the ratC contains account
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           containing the rate DNA sequence may be used in a computer based method for performing homology identification, comprising providing the rate DNA in the computer readable medium and comparing the polynucleotide sequence to at least one polynucleotide or polypeptide sequence to identify used in a computer based method for polynucleotide assembly, comprising providing rate in a computer readable medium and screening for at least one overlapping region between a the first and a second polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò

The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Her1) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer) and psoriaais. They are also useful as research reagents, diagnostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1 Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis. Human, epidermal growth factor receptor; hyperproliferative disease; Herl; antisense; prophylaxis; psoriasis; phosphorothicate backbone; /mod_base= OTHER /note= "2'methoxyethyl nucleotides"  $not\bar{e}=$  "2'methoxyethyl nucleotides" "mod_base= OTHER

The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumnous (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders.
                                                                                                                                                                                                                                                    leukaemia; neuronal disorder; stromal disorder; blastocoelic disorder; inflammatory disorder; immune disorder; angiogenic disorder; cytostatic; neuroprotective; PCR; primer; ss.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected results and (i) the clones in the multiwell reconstituted as the products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. AB142957 to AB145322 represent PCR primers for human chromosome 1p36-35 DNA, and AB145323 to AB145634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention Claim 4; Page 40; 528pp; Japanese. 12-MAR-2001; 2001JP-00068285. 10-MAR-2000; 2000JP-00066716. ```

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding reggion, 5 or 3 and ganomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of underly an in a subject, for reducing levels of enemesting levels of uncasarian environment in an increasing levels of underlying in a subject, for reducing levels of adenosine or lund an environment in a subject, for reducing levels of adenosine or lund environment lund environ lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Amethod (A) has been developed of delivering antigens to dendritic cells (DCS). (A) comprises contacting DCS with apoptotic cells (ACS) expressing an antigen where the contact allows the antigen to be internalised by the DCS, and where the ACS have been induced in vitro to become apoptotic. The DCS can be loaded with antigens such as antigens derived from cell carcinoma antigens, and melanoma antigens. In addition, self antigens that are targets of autoimmune responses or other antigens for which it is desired to attenuate an immune response can be expressed on donor cells using the methods, e.g. insulin, histones or GAD. The products can be used for the prophylactic or therapeutic treatment of diseases such as e.g. bacterial infections, protozoan infections, such as cor influenza, cancers or malaria, listeriosis, microbial infections, viral infections such as HIV cor influenza, cancers or malarial such as melanoma, autoimmune diseases such as psoriasis and ankolysing spondylitis. The present sequence represents a PCR primer used to amplify beta-3 from dendritic cells used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Aptastruc oligonucleotide; non-linear; target; self-annealing; hairpin; stem; TAR; HIV; tat protein; viral development; regulatory element; mini-exon; trypanosome; iron response element; ribozyme; ss.

The oligonucleotides AAT10455-82 represent examples of novel oligonucleotides designated 'Aptastruc'. The oligonucleotides have affinity for non-linear target sequences e.g a self-annealed hairpin structure. They have a complementary sequence to part of the linear (stem) of the target whereas the remainder (i.e. either end) of the oligonucleotide does not interact with the target sequence. The which binds to the tar protein during viral development. The novel oligonucleotides are generally targeted to regulatory elements such as mini-exon from trypanosomes, the HIV TAR or an iron response element. They may either bind to the target sequence to interfere with its regulatory role or may contain a functional group e.g. a ribozyme to cleave the target sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligo:nucleotide with affinity for non-linear target - includes a sequence preventing canonical interaction but able to form a complex, used to prevent development of viruses, bacteria and parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HIV; gag gene; amplification; detection; repair-mediated process; ss.

Oligomucleotide B is 1 of 4 blunt-ended sequences (see AA235292-95) used in an example of the gap-filling/ligating embodiment of a new repair-ce mediated process for amplifying and detecting nucleic acid sequences. The target was the HIV GAG region 2106-2153 (see AA235291). Blunt ends are created after incorporation of 2'-deoxyadenosine 5'-O-(1-tintriphosphate) (darpfelapha-S) at the 3' end of each sequence. A gap of 5 base pairs exits between oligomucleotides A and B or A' and B' when these strands are hybridised to their complementary strand of the target complementary strands of DNA target with a molar excess of complementary to the target, under hybridising conditions. In one embodiment, the OCPS may have a gap of 1 or more bases which may be complement (filled) by enzymes. The OCPS are joined together, forming a joined, oligomucleotide product. The target/joined product hybrid nucleic repaired (filled) by enzymes. The OCPS are joined together, forming a caids are then denatured to single strands again, at which point both the target and the joined products can form hybrids with new OCPS. The steps of the reaction are carried out stepwise or simultaneously and can be specific nucleic acid sequences associated with infections and/or mutations in the genomic DNA from any organism. The method is performed using heat-label and the joined products and form any arganism. The method is performed using heat-label and the inference of the organism. The method is performed using heat-label and the inference of the organism. The method is performed using heat-label and the method is performed using heat-label and the method is performed and the method and t

Oligomucleotide F' is 1 of 4 sticky-ended sequences (see AAZ35296-99) used in an example of the gap-filling/ligating embodiment of a new repair—mediated process for amplifying and detecting nucleic acid sequences. The target was the HIV GAG region 2106-2153 (see AAZ35291). The amplification process involves treating RNA or separate complementary strands of DNA target with a molar excess of oligomucleotide complement pairs (OCPs), the OCPs having sequences complementary to the carget wither hybridising conditions. In one embodiment, the OCPs may have a gap of 1 or more bases which may be repaired (filled) by enzymes. The OCPs are joined together, forming a joined, oligomucleotide product. The target/joined product hybrid nucleic acids are then denatured to single strands again, at which point both the target and the joined products can form hybrids with new OCPs. The steps of the reaction are carried out stepwise or simultaneously and can be repeated as often as desired. The

Oligonucleotide B' is 1 of 4 blunt-ended sequences (see AAZ35292-95) used in an example of the gap-filling/ligating embodiment of a new repair-mediated process for amplifying and detecting nucleic acid sequences. The trarget was the HIV GAG region 2106-2153 (see AAZ35291). Blunt ends are created after incorporation of 2'-deoxyadenosine 5'-0-(1-thiotriphosphate) (dATP(alpha-S)) at the 3' end of each sequence. A gap of 5 base pairs exits between oligonucleotides A and B or A' and B' when Example 1; Col 14; 33pp; English. process

Novel biallelic markers used to construct a high density disequilibrium map of the human genome. Claim 9; Page 2411; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6959 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies

which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the dentification of the targets for the development of pharmaceutical agents and disgnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. Novel dual-specificity mitogen activated protein kinase phosphatase polypeptide useful in screening assays for identifying agents that modulate activity of the protein which are useful for treating cancer and autoimmune diseases.

Example 1; Page 46; 60pp; English.

The invention relates to a human dual-specificity mitogen-activated protein (MAP) kinase phosphatase, DSP-3, and to nucleic acids encoding it. The invention also relates to variants of DSP-3 which retain activity, expression vectors and host cells comprising DSP-3-encoding DNA, the recombinant production of DSP-3, an anti-DSP-3 antibody, and a DSP-3 substrate-trapping mutant protein that has a reduced ability to dephosphorylate a substrate relative to the wild-type DSP-3. The invention additionally encompasses use of a DSP-3 modulator to modulate a proliferative response, cell differentiation or cell survival. The DSP-3

```
protein is useful for screening an agent that binds to DSP-3 and/or modulates DSP-3 activity, and is also useful for raising antibodies. DNA encoding DSP-3 or a reporter protein is also useful for screening an agent that modulates DSP-3 activity. The identified agents that modulate DSP-3 activity are useful for treating Duchenne muscular dystrophy, cancer, graft-versus-host disease, autoimmune diseases, allergies, metabolic diseases, abnormal cell growth, abnormal cell proliferation and cell cycle abnormalties. DSP-3-specific antibodies and DSP-3 antisense probes are useful for detecting DSP-3 expression in a sample. The present sequence represents a human DSP-3 RACE (rapid amplification of cDNA ends) PCR primer used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New dual-specificity phosphatase (DSP)-3 and DSP-3 alternate form polypeptides, useful for identifying modulators DSP-3 or DSP-3 alternate form activity, especially for treating e.g. cancer, autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; DSP-3; cytostatic; immunosuppressive; antiallergic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of the human dual-specificity phosphatase DSP-3. The DSP-3 protein is involved in cell signalling and the sequences can be used in the treatment of cancer, metabolic and autoimmune diseases, allergies, graft-versus-host disease, abnormal cell proliferation and Duchenne muscular dystrophy
                                                                                                                                                                                                                                                                                                                                                                                                                   Human; DSP-3; dual-specificity phosphatase; cell proliferation;

RESULT 87

The present sequence is given in a specification providing human dual specificity phosphatase-3 (DSP-3) and a murine DSP-3 variant polypeptide. The polypeptides are useful for dephosphorylating a substrate of DSP-3, e.g. MAP-kinase. They may be used to treat or prevent diseases associated with cell proliferation, immunosuppression, metabolic diseases, or abnormal cell growth or cell cycle abnormalities. They are also useful for identifying agents that modulate their activity. The modulators are useful for treating disorders associated with DSP-3 variant activity, e.g. Duchenne muscular dystrophy, cancer, graft-versus-host

```
The invention relates to a method of modulating angiogenesis in a tissue comprising mammalian cells by modulating pituitary tumour transforming gene (PTTG) expression and/or endogenous PTTG1 protein function in at least one of the cells. The method is useful for enhancing or inhibiting angiogenesis. Specifically, enhancing wound healing and/or tissue regeneration and limiting scar formation. The method is also useful in treating malignant tumours and retinopathy. The present sequence is a PCR primer used for amplifying human PTTG2 DNA which is used for inhibiting PTTG1 biological activity
                                                                                                                                                                                                                                                                                                                                        Human; pituitary tumour transforming gene; PTTC1; vulnerary; cytostatic; ophthalmological; antiangiogenic; antisense gene therapy; angiogenesis; wound healing; tissue regeneration; scar formation; malignant tumour; retinopathy; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating angiogenesis in a tissue comprising mammalian cells by modulating pituitary tumor transforming gene (PTTG1) expression and/or endogenous PTTG1 protein function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Melmed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yu R, Horwitz GA, Zhang X,
                                                                                                                                                                                                                                                                Human PTTG2 DNA amplifying reverse PCR primer 2-306R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 21 BP; 0 A; 3 C; 5 G; 13 T; 0 U; 0 Other;

```
The patent discloses pituitary tumour transforming gene (PTTG) carboxy terminal peptides. The invention also relates to methods for inhibiting neoplastic cellular proliferation and transformation (NP/T) of mammalian cells. The method involves delivering a composition comprising a PTTG carboxy-terminal-related polynucleotide, an expression vector comprising a pptide to a mammalian cell that overexpresses PTTG. The compositions comprising PTTG-C peptides are useful for inhibiting neoplastic cellular proliferation and/or transformation of a mammalian cell. PTTG-C peptides are useful in bioassays, as immunogens to produce anti-PTTG-C antibodies and in therapeutic compositions. PTTG antibodies are also useful for inhibiting the activation of mammalian T-lymphocytes. Sequences of the invention are used as vaccines and in gene therapy. The present sequence is a PCR primer which is used for amplifying human PTTG gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting neoplastic cellular proliferation and/or transformation mammalian cell, by using Pituitary tumor transforming gene carboxy-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The present invention describes a method for inhibiting neoplastic cellular proliferation and/or transformation of a mammalian cell. The method comprises delivering to a mammalian cell that endogenously over expresses pitutary tumour transforming gene (PTTG1), a composition of comprising, an expression vector comprising a promoter and a comprising, an expression vector comprising a promoter and a comprising a mammalian PTTG2 peptide the polynucleotide being operatively complying a mammalian PTTG2 peptide the polynucleotide being operatively linked to the promoter in a transcriptional unit, where PTTG2 is selected from: (a) a peptide (1) consisting essentially of a 191 amino acid canno acid residues 1-180; or (b) a mammalian PTTG2 peptide having at least 95% sequence bomology with (1). The expression vector is complexed with a cellular uptake-enhancing agent such that the PTTG2 peptide having complexed with a cellular uptake-enhancing agent such that the PTTG2 peptide is cransformation of the cell is inhibited. PTTG2 protein regulates cransformation of the cell is inhibited. PTTG2 protein regulates complexed transformation of the cell is inhibited. PTTG2 peptide molecules have the ability to down regulate PTTG1 gene expression and/or PTTG1 protein cellular proliferation and/or transformation of mammalian cells mainty the method is useful in inhibiting mainty than the properties of the ability to down regulate manner. The method is also useful in inhibiting cells and in vitro. The method is also useful in treating cells and in vitro. The method is also useful in treating consistent entered and and in vitro. The method is also useful in treating cells and the procession and the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    malignant tumours. The present sequence represents a PCR primer which is
                                                                                                                                                                                                                                                                                                                                                                                                   Novel method of inhibiting neoplastic cellular proliferation and/or transformation of a mammalian cell used for treating e.g. malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 0 A; 3 C; 5 G; 13 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 21; Page 99; 175pp; English.

```
The invention relates to inhibiting the activation of a mammalian T-
CC lymphocyte cell comprising inhibiting pituitary tumour transforming gene
(PTTG1) expression and/or endogenous PTTG1 protein function in the T-
CC lymphocyte cell; whereby activation of the T-lymphocyte cell is
continuibited. PTTG upregulates bFGF secretion and transactivates DNA
cranscription. Compositions and methods of the invention are useful for
inhibiting neoplastic and non-neoplastic proliferation of mammalian T-
continuibiting neoplastic and non-neoplastic proliferation of mammalian T-
cC lymphocyte cells, including activated normal lymphocytes and transformed
lymphocytes. The compositions and methods are useful in the prevention of
inhibition of xenograft or allograft rejection and in the treatment of
continuint encephalomyelitis, psoriasis, atherosclerosis and other
cc autoimmune diseases. The inventive methods and compositions are also
cuseful in the treatment of T-cell neoplasmes, such as leukaemia, or any
content sequence is that of a PTG related PCR primer, useful in methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                                                                                                                                                          Inhibiting the activation of a mammalian T-lymphocyte cell useful for treating immune-related disorders by inhibiting PTTG1 gene expression.

The invention relates to human SECX proteins (AAB23029-B23048) and to nucleic acids which encode them (AAA3616-A93611, AAA93673-A93666). The SECX proteins of the invention are either secreted or membrane-associated proteins and act as regulator of cellular proliferation and differentiation. SECX proteins or mucleotides are useful for diagnosing the presence of, or predisposition to, a disease associated with altered levels of SECX proteins and nucleotides. The SECX proteins are also useful to screen compounds that modulate SECX activity or expression. The interaction of a SECX protein with other cellular proteins may be useful to modulate the activity of a partner protein, cellular proliferation, cellular differentiation and cell survival. SECX nucleotides are useful for the recombinant expression of SECX gene. They may also be used to modulate SECX expression of SECX gene. They may also be used to modulate secx expression of SECX gene. They may also be used to condulate secx expression (e.g., using antisense oligomucleotides). SECX nucleic acid sequences are also useful for identifying a cell or tissue type in a biological sample, and in forensic biology. SECX primers or probes are useful for detecting the presence of SECX nucleotides and for screening tissue cultures for contamination. Diseases that may be treated or prevented using SECX proteins or nucleotides include cancer (e.g., colorectal carcinoma, prostate cancer), benign tumours, immune disorders (including autoimmune diseases, transplant rejection, allergies, AIDS), inflammatory diseases, transplant rejection, allergies, AIDS), skin disorders, cardiovascular disorders, atherosclerosis, restenosis, skin disorders, cardiovascular disorders, atherosclerosis, restenosis, or traumatic wounds, spinal cord injury), and skeletal disorders. The present sequence represents a PCR primer used in real-time quantitative present analysis of a SECX gene in an exemplification of the Sequence 22 BP; 11 A; 7 C; 3 G; 1 T; 0 U; 0 Other;

Example 6; Page 67; 118pp; English

The present invention relates to the isolation of human secreted or membrane-associated (SECX) polypeptides designated SEC1-SEC15, and the polymucleotide sequences encoding them. Also disclosed is a method for screening for a modulator of activity or latency of SECX. The SECX polypeptide and polymucleoride sequences may be used for treating or preventing SECX-associated disorders such as lung cancer, cardiovascular and oncology diseases, immune disorders, autoimmune diseases, transplant rejection, allergy, AIDS, infections, inflammatory disorders, arthritis, haematopoietic disorders, skin disorders, atherosclerosis, restenosis, neurological diseases (e.g. Alzheimer's disease), trauma, wounds, spinal cord injuries, and skeletal disorders. The present sequence represents a PCR primer used in the examples of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB8399), a sequence having 65% sequence identity to (SI), (CI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as commistream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) conceding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and creating cuseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of priented specification, but is based on sequence did not form part of the prime by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;

protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), (S1), and aving 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Grpases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding pather. (I) and nucleic acids (II) caused by altered expression of human POSHL including disease and treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oil gonucleotide useful in examples of the invention. Note: The present sequence aid not form part of the nerwort hy the Ruranean patent of the horazone by the Ruranean patent of the nerwort of the horazone.
                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated SH3 domain (POSH)-like signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; SEQ ID NO 1117; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Derwent by the European Patent Office

8 Db o; The invention relates to a method of determining mutation load, which involves identifying a somatic cell that contains accumulated levels of p53, amplifying DNA of the p53 gene from such cell and determining the frequency or nature of mutations in the amplified DNA. The method is useful for determining mutation load both in subjects who do not yet exhibit signs of disease and subjects who are presently treated using known cancer therapy to assess efficacy of treatment. The method is also useful to identify missense mutations in single cell from normal colon and prognesis and monitoring the effectiveness of cancer therapy and is useful for monitoring the mutational status of individuals over extended periods of time. The present sequence represents the human p53 sequencing Determining mutation load, by identifying a somatic cell that contains accumulated levels of p53, amplifying DNA of the p53 gene from the cell and determining the frequency or nature of mutations in the amplified Gaps . 0 5.0%; Score 14.4; DB 1; Length 20; 93.8%; Pred. The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and Daley GQ, Ireland JS, Bolk S, Example; Page 59; 242pp; English. (MILL-) MILLENNIUM PHARM INC. Gargill M, WPI; 2001-226749/23 atherosclerosis. Lander ES,

ö genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. ```
The present invention describes polypeptides (I), designated POLYX polypeptides (e.g. POLYI, POLY2, etc.), and the polynucleotide sequences (II) encoding them. POLY1-4 are members of the gamma aminobutyric acid factor (EGF) family; POLY5-8 are members of the epidermal growth factor (EGF) family; POLY9-11 are members of the complement receptor (HSPC) family; POLY13 is a member of the Naphotansferase family; POLY13 is a member of the supporter sequence (HSPC) family; POLY13 is a member of the prophosition family; POLY14 is a member of the supporter of the systexin family; and POLY17 is a member of the prohibitin family. (I) and (II) can have antidepressant, anticonvulsant, neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and antiarrhythmic activities. (I) and (II) can be used for treating or preventing a POLYX-associated disconder in humans as a therapeutic in the preventing are polymerated the presenting as a convision of the preventing and polymerate and preventing a POLYX-associated disconder in humans as a therapeutic in the
                                                                                                                                                                                                                                                                                                        New isolated polypeptides for treating a broad range of pathological states, e.g., depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral sclerosis, head trauma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            anxiety, muscle tension, epileptogenic activity and memory functions, cardiomyopathy and arrhythmogenic right ventricular dysplasia. The present sequence represents a PCR primer used in the expression of POLY11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pathological state in a mammal, especially patients suffering from, e.g., psychiatric and medical conditions, depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral sclerosis, head trauma, Alzheimer's disease, alcoholism, vigilance,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        manufacture of a medicament for treating a syndrome associated with a human disease selected from a POLXX-associated disorder, for treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 5; Page 142; 155pp; English.
